

Game Project Commentary

In embarking on my game project, I encountered a series of milestones that marked my progress through various programming concepts. Initially, I set up my development environment, which involved installing the necessary software tools and libraries. This step was crucial as it laid the foundation for the entire project.

As I began writing the code for my game, I started by implementing basic drawing functions and familiarising myself with 2D coordinates. This allowed me to create the visual elements of my game, such as the player character and obstacles. Through experimentation and practice, I gained confidence in editing and running my code, gradually refining the visual aspects of the game.

Adding interactivity to the game was the next step. I introduced variables to store game state information, such as the player's score and the position of objects on the screen. Implementing conditional logic allowed me to control the flow of the game based on various conditions, such as collisions between the player and obstacles. Debugging errors related to variable types and logical operations was challenging but ultimately rewarding as it improved the functionality of the game.

To enhance the gameplay experience, I incorporated music into the project. This involved adding an extension that allowed me to play audio files within the game. I created a function to handle the playing of music and integrated it into relevant parts of the game code, such as during gameplay and menu screens. While initially daunting, understanding how to integrate external libraries and use them to add features like music greatly enriched the overall experience of the game.

Throughout the development process, I encountered obstacles that required patience and persistence to overcome. However, with each challenge surmounted, I gained valuable insights and skills that propelled me forward in my journey as a game developer. By leveraging the knowledge gained from each stage of the project, I was able to create a game that not only entertained players but also showcased my growth and proficiency in programming.
